

Your world, within reach.

A personal AI computer.
Built around your voice,
your devices, and your control.

Vaibhav Sharma · Investor introduction
September 2026 · Concept / feasibility

Concept render

Work spans devices. Attention has to follow.

Our first customer hypothesis: technical founders and independent operators.

Calls interrupt.

An incoming call can break the task you were already doing.

Context scatters.

The file, browser, terminal, and next action live in different places.

Control is unclear.

Delegation needs a visible scope, a stop control, and a record.

We must earn a place beside the phone by completing a repeatable job better.

A computer of its own. A conversation that keeps moving.

Concept scene

Think locally.

Local speech, model and memory.
Browser and command runner.

Act with reach.

Approved devices and programs.
An iOS app for approvals
and receipts.

MOB is the central harness.

The model stays on MOB. Access to other devices is explicit and scoped.

Web access uses MOB's browser. Each remote action needs the right OS permission and adapter.

Intentionally physical.

112 × 72 × 26 mm

Target envelope, subject to mechanical and thermal validation.

Designed around daily use

Magnetic back + Qi input target
Flush-stowed USB-C lead
Physical mic cutoff + crown
Serviceable battery

Start with components that exist.

Part / subsystem	Candidate	Size (mm)
Local compute	Open-Q 8550CS · 16 GB / 128 GB option	54 × 45 × 3.61
Bluetooth bridge	Microchip BM83	32 × 15 × 2.5
2 × MEMS microphones	Infineon IM69D128S	3.5 × 2.65 × 1 each
Speaker reference	1 W / 8 Ω · Adafruit 3923	30 × 20 × 5
Battery target	7,000 mAh / 3.7 V custom pouch	90 × 60 × 12 allocation

Module dimensions are published facts. The enclosure, carrier PCB, cooling, and battery fit remain engineering work.

Always ready is a power problem.

A half-day target needs low-power listening, not continuous full-speed inference.

25.9 Wh

Nominal battery target

≤ 1.83 W

Average required for 12 hours*

~3.7 hours

Illustrative continuous 6 W use*

Prove latency, call audio, takeover, thermals, and battery before promising performance.

*Assumes 85% usable energy. All power and runtime figures are planning assumptions; no MOB measurement yet.

Earn a narrow, repeatable habit.

A proposed 20-unit, 30-day pilot with technical founders and independent operators.

01

Sourced research

Compare public information and save a brief with source links.

02

Local-file work

Find approved files and create a useful draft on an enrolled computer.

03

Assisted calls

Validate a paired call, echo control, explicit handoff, and human takeover.

Measure task success, response latency, intervention rate, runtime, and week-four use. Publish failures too.

Build a business around usefulness.

Initial distribution: founder-led outreach → qualified early list → pilot → crowdfunding.

Hardware first.

A device purchase is the working model.
Core local use should not depend on
a mandatory cloud subscription.

Let quotes set the price.

At an illustrative \$649 selling price,
a 45% gross-margin goal allows
~\$357 landed product cost.

Illustrative scenario only. Price, costs, willingness to pay, support burden, and acquisition cost are unvalidated.

The route to a shippable product.

Phase	Indicative window	Exit evidence
Feasibility + bench	Weeks 0–12	Compute / speech / call loop; supplier quotes
Engineering validation	Weeks 13–24	Custom carrier, fit, thermal and RF pre-checks
Pilot + campaign readiness	Weeks 25–32	20-unit learning; working footage; costed plan
Design / production validation	Weeks 33–48+	Certification, factory tests, yield, service plan

Kickstarter follows prototype proof and creator eligibility. No shipping date or production commitment yet.

Fund the proof. Build the team.

Illustrative 12-month planning envelope: \$750,000. Round terms are not set.

Workstream	Planning allocation
On-device software + iOS	\$275k
Electronics, audio + mechanics	\$175k
Validation, certification + tooling	\$125k
Pilot operations + launch	\$75k
Contingency	\$100k

Vaibhav Sharma

Founder · Kota, India
Developer of AI tools and
voice-first systems.

Next hires / partners

Embedded Linux & audio
Mechanical / thermal · iOS

Let's build the personal AI computer.

We're looking for investors and engineering partners who will help turn the architecture into measured proof.

The next conversation

A 20-minute review of the thesis, the bench build, and the milestones that would justify the first round.
